

## 2024-05-24 - Graham and John speak with Professor Robyn Cosford

Well, hi everyone and welcome back to Club Grubbery. G'day Johnny Larder. G'day Woody. How are you going? I'm good, mate. Friday the 24th of May, we've been smacking it out this week. A huge role of interviews so already and we're going to kick off next week with I think a full five days of Club Grubbery programs.

We're catching up on lost time. So it's funny to talk about. Well there is and we've got some great guests lined up and we always say that and we always have great guests lined up like the one we have tonight in Professor Robin Cosford. Welcome back on Robin. It's great to see you again. Hi guys. Great to be here.

Incredible times. Cheers. They are incredible times and you are coming to us from Bath in England in the West country and, uh, I used to live, uh, I used to live just near Bath for a short time at Cadbury Heath and, uh, I have fond memories of a pub in the, uh, in one of the little arcades there called the, uh, Cour de Lyon.

The Cour de Lyon. It was a tiny little pub. I think it's one of the oldest pubs in England. But anyhow, and you, uh, of course, in the town where, uh, Dr. Tess Laurie lives, and please give her our warm regards. We, uh, we love what she's been doing. Yes, certainly. I was very blessed to be able to attend one of the meetings that she was holding with the Dr.

Brett Weinstock, the biologist, and had lunch with her the other day as well. So, you know, we're in good communication. She's a great lady with a great heart and she's certainly doing a lot of good. Right. Well, we're hoping you'll pull some strings and get her on the show with us because our viewers would love to hear what she's got to say.

But in the meantime, before we talk to you about why you're on the program all the way from the, uh, from the other side of the, uh, the world, uh, one big news item that sticks out today, John, is, uh, Ben Fordham on 2GB quoting a Brisbane, uh, identity. He came out and said, I've had six doses of COVID vaccine and I've just had a really bad dose of COVID.

It's knocked me for six. Literally for six. That person is a former Channel 9 news anchor from Brisbane, Bruce Page. And I watched the interview that he did for Channel 9 and he's looking very old, I must admit. Uh, he's not looking very well. Um, and after six jabs, I mean, what can we expect? But, um, Bruce finished off his tale of woe by advising everybody to go out and get their boosters and, uh, socially distance and wash their hands and keep wearing masks and do what we did in the good old days.

Uh, Bruce. You're the trusted source of news in Channel 9 in Brisbane. You were for many years. Um, I'd love to sit down and have a chat to you about what's really going on, but we hope you get better soon, Johnny. What can we say? Well, Hoodie, I mean, the interesting part about this was, uh, when it, when it popped up, um, on Ben Fordham's, uh, program.

There was just little snippets, grabs taken from the interview. And there was no dialogue to suggest that this guy worked for channel nine. In fact, he still is on, on the, on the, uh, on the book series, apparently the seniors reporter, whatever that is, uh, he must run around nursing homes, uh, looking for stories.

I don't know what that means. A seniors reporter, but anyway, uh, he is not mentioned. Of the fact that he's with channel nine. It's just like they plucked some guy off the street that suddenly says, Oh, wow. You know, I've had six of these, but I was alerted to it because Gerard Rennick is actually running, uh, the Senator Gerard Rennick is running the story as well on his Facebook page in its entirety, the entire interview.

Uh, which is obviously this guy that you're familiar with, Hoody, uh, you know, obviously people in New South Wales and Victoria and other states won't be, uh, familiar with him, but, uh, yeah, very interesting, isn't it? It is, and Professor Robin Cosford, uh, would having six vaccines, no, not vaccines, would having six inoculations against COVID, uh, be playing with, uh, Bruce Page's immune system, might you think?

Absolutely. We've got such solid data, you know, on all of this now. You guys probably know that an Australian group published the paper, lead author was Professor Peter Parry. We published a paper called Spicopathy. And we detailed all the effects in that from the world literature, and I can say we, because I'm one of the co authors, detailed all the, you know, the world literature on, on what is happening, and it is indisputable, absolutely indisputable, that these injections are causing immune system dysfunction.

So they are causing our bodies to make a whole heap of What we call non neutralizing antibodies, which means a whole heap of other antibodies, which actually do nothing to stop COVID, but cause a whole heap of other effects. We're also, once people have got to the six jabs, well, in fact, we see this effect from three jabs, they start making a particular type of antibody called IgG4.

It's called isotype switching, which means IgG4 is an antibody that is non functional. It is basically designed to tell the immune system, shut down, go to sleep, you are now going to be tolerant to this. So it's like the immune system gets overhyped, makes the wrong antibodies, and then is told to shut down.

So he will have IgG4 antibodies beyond what should be. We're not meant to have many of those, you know, at all. And then the next thing that we know, and we know this from two big Cleveland studies, Cleveland U. S. Clinic studies, where what they've done is they've, and they've got hundreds of thousands of employees.

So they're big studies. I think the last one was 80, 000. It's a big study. And they've monitored them, and they were required to be vaccinated. So, so they've been monitoring them before a certain number of vaccines. They've been monitoring to look at the effects of the booster. And what the Cleveland Clinic studies have shown very clearly is that the more you are vaccinated, the more you are at risk of COVID.

New South Wales figures from 2022, they stopped publishing them after that, but the New South Wales government health figures where they did separate out, so the November December 22 figures are just beautiful to look at. You really have to do a hunt to find them because they're now well buried. But what they show very clearly, once they separated out the unvaccinated, as in really not vaccinated, to the first, second, third, fourth, compared to unvaccinated.

And what they did lump together initially was unvaccinated and we don't know their status. So they could have been anything when they did that, it didn't look too bad, but once they separated out the unvaccinated and we need to bear in mind as well, that the criteria for unvaccinated still applies to someone for the first two weeks after they have been vaccinated.

So the unvaccinated had Zero hospital admissions, zero ICU or zero ICU admissions. There were six deaths, but they were not in hospital. Compared to hundreds, 800 I think was our peak figure for the four vaccinated. Um, hundreds of deaths for those who've been vaccinated. So it is very clear. Very clear that the injections do nothing to prevent you getting COVID and indeed it appears the opposite, that the more you're injected, the more likely you are to get COVID.

And get it seriously and have it queued. Well, Johnny, you've said it before, you couldn't make this stuff up. And, and, uh, we're seeing this clearly now, Bruce Page, we hope you live a long and happy life, but you may have a diminishing audience if you keep pushing them to be vaccinated. And we're not making light of this because there are a lot of people in aged care who were put in an awful position where they had to be.

And then we had this ridiculous situation where you couldn't visit your parents in aged care if you hadn't been vaccinated when the vaccine was meant to protect them from it. From you anyway, whether you were carrying

Covid or not. I mean, none of this. It's a wonderful thing that, that Bruce, uh, hasn't appeared on the Ray Hadley show today because I mean, Ray, Ray would, uh, be quick to jump on this because really Bruce is a miracle.

Bruce is a miracle of mRNA vaccines. Uh, he's had six and if he hadn't have had six hoodie, he'd be dead. Uh, he really is a modern day miracle, Bruce. I mean, if you go to, if you go to the, uh, page of Senator Gerard Rennick, there's, there's a, there's a lady there that's put a post on it and I'll read it. I mean, it just flows beautifully into, into Bruce's story.

Uh, just had my sixth booster. I spent five weeks in hospital and, Two with hospital in the home. If I hadn't had the previous five boosters, I wouldn't have made it. Major organs were attacked. It is now six months since I had COVID. Didn't feel too bad, but then it attacked the organs in my body. First the bowel, then abscess on the liver, then the lungs, areas around the heart.

I'm still under specialists, but finally, and slowly turning the corner. Believe me, this is serious.

Well, so, so what people aren't recognizing, and even the doctors aren't recognizing, and this just blows my mind because it's really so basic. When you get an infection, you get COVID, the virus itself, and even, you know, there's issues around that story. But when you get COVID, the spike protein is produced for a brief period.

In the time where you get what we call viremia. And this is how it happens with any virus. You get an acute virus and it's DNA. That's what the viruses are. They're genetic material. They trick our cells into making more of them. So that happens with any virus. And you get this viremia, you get this stage where suddenly your body's swarming with all this stuff.

And that's when you feel, and then it clears. The body doesn't keep on making it. However, the injections are designed because it's modified messenger RNA. They are designed to go into our cells and to trick our cells to continue making spike protein, continue making spike protein, not a one off, not just at the time you're injected, but continue making spike protein.

Now, we don't know how long for each injection that happens for. We do have studies up to one year so far, at least one year. So we know it can happen for at least a year, but each subsequent injection triggers the body to do that more. So to blame the effects of COVID on COVID in someone who's multiply vaccinated, biologically, biochemically, virology, whatever way you want to look at it, if you're looking at it properly from a scientific perspective.

Simply does not make sense. Yes, the COVID can give an acute flare because you're just getting another boost to the levels that are being made. But you are making them themselves, yourself in the background, continually. We're seeing in Australia, Jonnie, in the last couple of days, we've seen mainstream media pushing the fact that there's this new flirt variant coming out, and it's It's going like, it's going gangbusters, you know, it's coming to a, a bed near you, let's say, um, and yet at the, at the end of it, they say, but we're lucky because this, this particular variant is very, very weak and probably has very little effect on us.

Robyn Cosford, are the mainstream media, um, complicit? In driving fear into, into the hearts of people in Australia where they've got to listen to the mainstream media to find out what to be afraid of. Why is the mainstream media, do you think, pushing that narrative about an illness which they say is benign?

Why are they so scared of it? Why are they boosting the fear? These are the, the tough questions to ask. You think you've all heard about the Trusted News Initiative, which was introduced back in 2020. So back at the beginning of all of this, all the heads of the media around the world were basically made to comply to this thing of Trusted News Initiative.

You are only going to say what we say you can say. And that's why we had all the talking heads around the world saying exactly the same things at exactly the same time. Because they're basically told what to say. So you can go into all the questions of why is that? Well, you can look at who owns the media.

So that becomes another question. We look at the questions of the power being wielded by the pharmaceutical industry and the payments involved in all of that. Media is not I mean, media costs money, you know, as, as you guys know, you know, it costs money to do anything in the media. Uh, and so alternative media has the same problem.

It does cost money. Mainstream media gets their money from advertisers. Mainstream media gets their money from the powers, from pharmaceutical industry. Just look at the, the pharmaceutical ads that are everywhere. So, it really comes down to a, You can go another level and, and this is where, you know, it's, it's possibly moving to conspiracy theory where we say that we've got deliberate PSYOP combined.

PSYOP is short for psychological operatives. And this comes out of the work of CIA and there certainly are things that track back to that. You know, we, we do have papers, we do have things that do track back to that. But even leaving that alone, we can simply say that it is in the best interest, commercial interest.

of the mainstream media, commercial interest of the pharmaceutical industry to drive up the fear that will push people back into taking more of these vaccine injections. They're not true vaccines. These genetically modified injections that is going to boost their profits. Unbelievable. And all this is being done under the direction and auspices of a, of a very sinister organization that's come to light in recent years.

And that's the World Health Organization, the WHO. And who are The Who? I mean, that, that's the big question. I mean, The Who for me in my younger days was a great rock group out of the UK. Um, but The Who Live at Leeds was my favorite album. Um, I'm not looking favorably on watching The Who live in anything at the moment.

What are they? You're over in London because you, we've got weeks to go before this pandemic treaty starts to look like it's going to be ratified and we've got politicians in Australia who are saying, we're not getting to vote on this thing, this is being decided, this treaty is being decided by bureaucrats, but more of them are waking up thanks to a lot of our loyal followers and many others, driven by information from people like yourself to get active and get these people, um, talking to the bureaucrats to make sure they don't do anything stupid.

Why should Australia, or any other country for that matter, bail out of the Hoos? Well, I guess we've first got to ask what, what's happened to, to the WHO. So, so WHO was originally founded post World War II, came out of the League of Nations, and it was ostensibly to help in, in total world health. And there, there was good work that was being done, but, but there became a shift in, in the WHO towards the end of, of last century, and it became more and more taken over by what's called public private partnerships.

As in instead, so originally who was set up and funded purely by the countries themselves. And it was, it was contributions both voluntary and fixed from the countries that enabled that. But, uh, but you could say in a paragraph, in a money grab, however you want to put it, for whatever reason, there was increasing formation of these public private partnerships.

Now what we need to be aware of is that some of your top countries in the world have greater funding than countries. When we actually look at it on straight finances, the pharmaceutical industry as a whole, and in fact, when we come down to individual companies, we're talking greater turnover, cash turnover than the GDP of your 20 lowest countries.

I did a lecture on this for the, um, conference in, which one was that? One of the World Council for Health Conferences in 2022. So the figures are staggering. So by who, by linking men in these private public partnerships had access to a great deal more money, but it also meant that the private partnerships were able to hugely influence what the who was doing and shifted across in favor of generating profit for the private partnerships away from the actual benefit of the countries.

Still guised as being for the benefit of the countries and the benefit of the country's health. But that's really not it, not what it is. It really is about creating global markets for these private partnerships. John. Rowan, what's the, uh, what's the mood over in the UK at the moment? Because from what we understand here, the UK has chosen not to, uh, sign up to this treaty, this WHO, uh, treaty.

And it looks as though at the last minute, they've really started to tinker with it because they. They probably sense that, uh, it, it was a bridge too far where they were at in relation to coming into people's homes and taking over countries and they have retreated a little bit from that from what I understand, but, uh, it, it, it, it's only because of what we're doing.

I think that that's even, even happened, but the issue will be once they get a foothold, it'll be a grab then, and we won't know what's going on. Um, the UK have obviously sensed that. Um, that's going to be the case and I've opted out of it. Um, have you heard anything on the ground there? So Andrew Brigden, uh, over here has been working very hard, uh, in the whole of this arena.

So I think he has succeeded finally in at least getting, let's say a temporary halt in the UK. But UK's attention is being diverted and I'm, I find myself wondering how much of this is a deliberate. Uh, yeah, deliberate play, let's say. Only two days ago, the defense minister announced public, on public media, MSN, uh, that people needed to start stockpiling food.

They needed to have a stockpile of three days food because we're about to go to war with Russia. In fact, we are at war with Russia. So people's attention is being diverted to the fear of war. This is, and I have, I have no doubt that this is part of a concerted effort. Absolutely. Distraction for a deliberate time.

Absolutely. And I imagine too, this is about, uh, um, the current Prime Minister there getting re elected. I mean, there's nothing better than a good war, is there, to, uh Exactly. And they've moved the elections forward two months. So, you know, there is definitely something afoot. There is definitely something afoot over here.

The stated aims for their refusal to go along with the treaty, though, Robin, aren't all that altruistic. They, uh, they have seen from what I've read that they, they don't want to go along with the treaty because they don't want to give their vaccine stockpiles to third world countries. Is that what's going on?

Yeah, basically. Uh, and then third world countries are not accepting the treaty as it is because they want more equality. And so very few countries are actually stopping it for the right reasons. Absolutely. But, but John, what you said is correct. They have fairly quickly and somewhat quietly been backtracking on, on the totality of the amendments they want put through.

Uh, there are many reasons for this. They, they are actually, it is actually illegal because they didn't get the documents. done in time for countries and everything to go over it. And that this is a World Health Organization owned legal requirement. So they didn't meet their own legal requirement. So that hasn't happened.

Uh, and they can sense there is a lot of, let's say, disturbance amongst the ranks. What they're trying, their watered down proposals though, are still extremely concerning. And again, you look at what's going on around the world and everyone is starting to hear about H5N1. Oh dear, bird flu, avian flu. Oh dear, we had 400, 000 chickens euthanized in Victoria, I understand, only a couple of days ago.

They're finding it uncanny. And they're, you know, so they're This comes under the category of this big thing they're talking about now called One Health. So the big thing that who are likely to get through and they are now pushing really hard to get through is that they will become the one unifying data collection point for all the world's pathogens.

Or not even yet pathogens, but you know, okay, it causes a flu in chickens sometimes, but we need to bear in mind 400, 000 chickens euthanized on the basis of what? A PCR test. Let's remember what those PCR tests are.

That's how they work. As in, you can falsify pretty much any positive you want just by changing the number of cycles of the PCR test.

Were those chickens all symptomatic of chicken flu? No, but they are using this PCR test to determine where they want to find avian bird flu.

They'll start with the, and they are starting, with the big farms, you know, the big caged manufacturing type units. They're starting with those places. They're the easy ones to do. You've got a whole heap of chickens in one place. But let's not kid ourselves that this has anything to do with care and concern about the health of chickens who are caged.

No, because they're going to spread it from the cage farms to the free range farms to the organic farms. They're going to make it that everyone who has any chickens anywhere has to register their chickens. Imagine we have to register our cat and dogs. Now we've got to register our backyard chooks. Why?

So they know exactly which houses to go to to say kill them. Just like they're dealing with the bees. Yeah, and after, after eight months or so of eliminating hundreds of thousands of hives in New South Wales, they decided they couldn't control it anyway, and they stopped doing it, regardless of the fact that most of the hives didn't have varroa mite.

I mean, it's just, anyway, there's a very sinister reason why they're trying to control food supplies at a time when Due to our population, uh, we should be encouraging the growth of food, people growing their own fruit and vegetables and, and living a healthy lifestyle, um, which is where we have to go. We have to make the choices that that's what we're going to do.

People need to learn how to live healthily, take back the responsibility of their health from the pharmaceutical industries. And the doctor, sorry, but I was one. Um, not proud of where medicine is now. We need to take our health back. We need to be responsible for that. We need to learn how, all the patterns of healthy living.

And that's what my Healthy 100 program is. But we need to learn how to do that. We need to learn how to eat correctly, how to grow our own food. How to be self sufficient, we, we've got to do this, this is our only way out of here is to, instead of giving more and more power to the authorities, more and more power to the doctors, more and more power to the pharmaceutical industry, more and more power to all of these, we've got to take that back and become responsible for it ourselves.

You know, way back, uh, we, we rescued a peacock here a long time ago. And the bird was running around, um, coughing and it was wheezing. It could hardly breathe. It was listless. And it obviously had a, it had a dose of the flu. And Michelle gave it a massive injection of vitamin C and the next day it was fine.

It was fine. We thought we were going to bury it. And it was fine. It's still running around the place today. I mean, you know, Dr. Ian Brighthope, who you know very well, has been working with us because we've had a bit of a chest infection. We probably had flirt because Michelle and I do a lot of that with each other.

Um, but. Um, we, uh, you know, he's just, he's just given us massive doses of vitamin C and it's work to treat. Um, yeah, we don't have a health system in this country. We've been saying it for a long time. We have a disease management system and, and I'm encouraged by the efforts that he has made and you and others to try and encourage our, our governments to implement proper health, uh, procedures.

I mean, if they were really serious about health Robin, wouldn't they be limiting our access to fast foods, to cigarette, tobacco, and alcohol and all those things, wouldn't they? Well, absolutely. We tried putting in a sugar tax that doctors combined a number of years ago, tried to get through a sugar tax so that they wouldn't pass it.

So this is exactly the point. And you look at the measures they introduced to control, keep us well from COVID. had nothing to do with building background health, health and wellness. In fact, it was the exact opposite. We're going to lock you in your houses. You're not allowed to get out and see sunlight and have fresh air.

You're not allowed to go out and socialize. You have only a limited capacity to exercise. You can't get to, to the markets where you get fresh fruit and vegetables. We're shutting those down. No, you've got to buy from the supermarket, supermarkets where it's mostly packaged. And if it is fresh vegetables, they're not fresh.

They're several days old and being stored. And so on and so on, but you have to wear masks. So you can't breathe properly. You know, there was, it was nothing whatsoever to do with improving background health. Not. And, and look, uh, Robin, I mean, we, we've given up this, uh, power, haven't we? I mean, we, we've, we've basically divested the, the responsibility of health to a number of bureaucrats.

I mean, look at a PRI mean, it can't be any coincidence that the, uh, the head of a r is a former WHO employee. Um, how is it that these people just have sailed into these spots? They're either graduates of, uh, one of these outfits or, uh, or, or they're obviously, uh. It's been handpicked by bureaucrats to, um, to ensure that it's going to be difficult for us to, to, to make changes.

Exactly. Well, I mean, we need to bear in mind we are, most of us, there are some who've been, who've known for a long time. I've been, been in this game a long time, so none of what's happening is a surprise to me. I've seen it coming. But I must admit, I didn't see it coming quite so soon. I thought we had about another five years before it would hit.

But for most people, there's been this sudden, Oh, something's going on. The powers that be have been working on this for decades. And in fact, the bigger concepts behind that, you know, as you would would know, Graham, we're talking about hundreds and thousands of years. It's been in there. There's a great book written by a Messianic Jew.

Jonathan Cahn called The Return of the Gods. If anyone's interested in looking into historical precedents and, and the, if you like, the spirits, let's say, that, that are attached to that and are coming and manifesting now, it's a really good book to read. So, you know, this, this is not, this hasn't just suddenly happened.

This has been a long time in planning and, and there are two good analogies. One is a noose that has been put around the whole of everything, slowly tightening. And the other is a frogs in a boiling pot. You know, they've been slowly turning up the heat, slowly, slowly, and most of the frogs are still happily asleep and will stay asleep in this boiling pot until they're boiled alive.

There are some who jump out. When they're covering for one another. I mean, look at, uh, you know, Senator Gerard Rennick. I mean, he's in there. Fighting, asking questions of these grubs that are running these organizations about some 17 year old kid that's allegedly died from a shingles vaccine. Why is a 17 year old getting a shingles vaccine?

I mean, it's not even recommended for 17 year olds, but here we go. They're out there, you know, pushing this stuff and nobody wants to respond. Uh, they just, oh, we can't, you know, Mr. Rennick, it's likely that we won't be able to give you any information about that because of the, uh, confidentiality, I mean,

mad. It's absolutely mad. And confidentiality means nothing to them when it suits it. So in my situation with, with APRA, they just walked in to my practice or, yeah, instructed my practice. They just, they took 30 of my patient files. And when my patients all expressed confidentiality issues, we don't want you to do that.

They just said irrelevant, doesn't matter, uh, we're all doctors, we're just taking them. So confidentiality, when it suits them, means nothing. But if they can use it to Block access to things that they don't want people to have access to. Yes. It will suddenly be a confidentiality issue. You've done a lot of work examining this health, uh, this WHO, uh, pandemic treaty.

And there's a lot of, uh, a lot of fear mongering out there about, you know, what, what can actually happen in the next pandemic. If the WHO win this, what would Australia look like if we had a, a, a massive pandemic as declared by them? What would, what would happen to our way of life here? Well, it really does depend because the bottom line still comes, it has to be implemented by each individual country.

So it is still about, are we going to be foolish enough to follow and implement that? But basically you think COVID and a step above, because that COVID was a trial run for them. That's all it was. It was a trial run for them. How compliant is Australia going to be? And dammit, we were way, way, you know, we were like a bunch of cockroaches that rolled over and just went, uh, I was not impressed.

Yeah. Yeah. Yeah. So they, they, they, it was a compliance test and they've even, there is even a WHO document that says that it was a test of compliance. So now that they know Australians by and large did comply very readily to everything they said, they are going to roll that out only another level again.

So the vaccination issue I believe will become forced even more so, they will remandate. And they will go chasing people who do not comply, they will go back to restricting. If they do it through the bird flu, which is the, looks to be the next cab off the rack, they're working very hard on the bird flu at the moment.

If they do it through the bird flu, we can anticipate that they will be saying you can't, you can't go outdoors because any bird and any animal can have it. You can't be living in the country because you're in contact with animals and any animal can have it. You can't have animals yourself because any animal can have it.

So they're working hard to prove what animals bird flu is making it across into. They're finding it in cows. There've been a couple of human cases, no deaths, but they're working hard on it. And there is absolutely no reason they can't do the same with the bird flu virus as they did with the bat virus, the coronavirus, right?

There's no reason they, in fact, we know they are, they will be, they've already got vaccines approved. Their vaccines are stockpiling already. So whenever they're doing a vaccine stockpiling ahead of something, you know, it's coming, right? It's, it's coming. Well, I've been telling us the next big one is avian bird flu.

Yeah, well, they're pushing it. They are pushing to get people scared of it. They and that's what all the media hype is about. We're trying to get this into your mind. We're trying to get you scared of it. They're pushing to get people scared of it. They're pushing their damndest using the PCR testing to find as many animal reservoirs as they can to justify both killing those reservoirs, but also saying to everyone, Oh, animals are dangerous.

You, you don't be around animals or birds. You don't have your own chickens. You'd better not have your own cows. And, uh, That all, as you touched on earlier, is, is also part of the, the excuse, let's say, to be able to eradicate much of the food industry, beef, dairy, cattle, chickens, all of these to eradicate much of that, which will make those foods no longer available or very limited availability and extremely expensive so that more and more people have to go across and eat the Bill Gates lab farm grown crickets.

So it all comes back to this, to this thing of wanting to control and to engineer across to the benefit of the industries owned by the certain elite groups. I was looking at an interesting, um, interesting documentary the other night on, uh, on the, um, potato blight, the famine in, in Ireland and what it did to the Irish people.

And, um, The train of thought is that that, uh, that was introduced by the British government to, to lower the population of Ireland and, uh, it had dramatic effects and it led to a whole bunch of Irish people coming and settling in Australia and we're grateful for that. Um, I mean, it's, it's just no end to what you can think about all this stuff, but we've got to deal with what we know and what we know is that if this treaty goes through and the Australian government blindly follows it, next time we have a pandemic, Uh, Tedros, funded by the Chinese Communist Party and Bill Gates will be running this country.

Absolutely. We'll, we'll effectively be running this country in the sense that he will be issuing his commands from WHO headquarters, that once Australia has signed this, we will be legally obliged to follow. And, and that's, that's how it works. That's how it will work. With our current prime minister, we're all filled with, uh, With confidence, are we not?

Unfortunately, we, we, we're other, other than some of our background senators who are doing incredible work, we, we, we don't have people in key positions in, in the, in the parties who are taking a stand and saying and doing the right things. Tell us about the, uh, Geneva project. Yeah. So the Geneva project, um, is, has been birthed, birthed out of, so this is a group that were working, uh, already in the beginnings of, of the pandemic and everything with both with Tess Laurie, so World Council for Health.

And, um, so I got to meet all this group through a number of conferences that I was invited to speak to one in Brazil and then one in, in Austria. Yeah. In 22, I think that must have been last year, oh, she was 23, so 22 and 23. So, so some of the core of this group have, have set up another one called Inspired Global Summit.

They met last year and they're meeting again this year. So within this, this group, we have some of your top international lawyers, Philip Cruz, who's possibly your top international lawyer at this point in time, who's based in Switzerland. You know, rather formal because, uh, right, my, oh dear, my tongue's getting caught over that one now.

But, um, but so Philip Cruz is arguably, uh, our top there now. We've got Jessica Rose in this group. We've got Robert Maloney. We've got Ryan Cole. The list goes on of top names that people will have heard who were part of this group called the Inspired Global Summit. And this group, we've got a number of Canadians.

So Shari St. Louis, who's the chair of Children's Health Defence Canada, was involved in the Canadian Truckers Convoy. So we've got a number of very active Freedom guys who have organized a convoy. So I'm getting there. So the Geneva Project has got three components. There's a convoy, the Road to Geneva, it's called, that is being organized, that looks like it could be bigger than the Truckers Convoy Canada.

It's looking that it'll be huge. So we're calling Europeans, you know, anyone from around the world to be to being involved in that. Then there's a one day where those of us in the the ICS group and it's an invite only 35 I'm told, which is pretty amazing. We're brainstorming around all these issues of Not so much trying to block the who, it will, by that time it's going to be too late, whatever they get through, they will have got through.

Um, all these background work is being done by the Aligned Council of Australia, trying to wake people up so that we can, you know, get some action to say we don't sign and so on, all of which is vital. But the think tank is more about this thing of the positive side of looking forward of how do we build and what are we building.

We're spending so much time looking at the bad that's happening. We have to start spending more time looking at what are we building. The systems of the world are coming down. Are we, are we, yeah, are we going to be there to build and rebuild new systems? Or are we just going to let them take it over and do it their way?

So that's what that think tank's about. Then there's a big rally, uh, the following day, the Saturday. And again, the list of speakers is incredible at that rally. Again, Ryan Cole, Robert Malone, Jessica Rose, and so on. And Philip Cruz, and so on, and so on, and so on. I'm not speaking. I'll be on platform, hopefully waving the Australian flag, if the flag I've ordered.

arrives in time. I'm hopefully waving the Australian flag. I'm the only Aussie on platform, so I've got to have a flag. But anyway, um, Yeah, so it is very much what we're hoping to do, what they are hoping to do, is to generate a great deal more public awareness, and it's going to be live streamed in Australia through TOFA Field.

So we've, so Katrina of Stand Up Australia has managed to organize that. Thank you Katrina. Um, so it is going to be live streamed into Australia. So, so the hope is that, that we can generate a lot more awareness of people

that things are happening globally, that we need, we need to be aware of. It's not just about the parochial little Australia down here.

We, we can't manage this if that's, if that's all we are. Yes, we have to be that, we have to look after our country's needs, but we've also got to be aware of bigger stuff and be working with those people who are doing the bigger stuff. So, well, if your flag doesn't arrive, Robin, um, uh, you can just supplement that with a white pillowcase because that seems to be the flag most Australians are waving over here these days.

Yeah, I guess I could. I mean, surrenders the name of the game over here, isn't it? Everybody watching us. No, I know the people who are watching us don't do that but I might buy but that's I might buy uh a white pillowcase. Put something on it. But um, yeah, I mean, that's it. Exactly. Surrender is the name of the game for most people.

That's back to the cockroaches. You know, we're, we're on our backs and we're just saying, Oh, that's where they want us. And they do that by fear. People need to recognize that as soon as we let them put us into fear on anything, fear of the health, fear of the economy, fear of whatever, as soon as we come.

Yeah, the climate. I mean, that's another crazy big one for Australia. I mean, at least all the stuff is now coming out about chemtrails. We've actually got published papers and things happening for that now. It's not conspiracy. It's conspiracy. It's not conspiracy theory. It's conspiracy fact. Like so many things, you know, start off with conspiracy theory and later we find their conspiracy fact.

So that's one of those ones. So they are geoengineering the skies. Because they are trying to induce their own type of climate change. I mean, in the UK here, and I am seeing this, what they've got now is control zones, air control zones. So within these air control zones, and they're all monitored with cameras and all the rest of it.

So they're looking at the number plates and the types of cars and everything that are in there. If you drive an old car, into an air control zone, you are fined big time. So it basically means that your poorer people can't afford to get into these zones. So the workers with their, with their trucks, they have to have super modern emission, low emission, no emission.

What could possibly go wrong, John? What could possibly go wrong? So what date is this Geneva project happening? So the, the road to Geneva starts on the 29th of May.

The, uh, the meeting and that will be, so that's over a couple of days, obviously in building up as it comes towards Geneva, the aim is that they land in Geneva in time for the rally on the Saturday, the 1st of June, uh, our meeting is on Friday, the 31st, which is the last day of the who meetings. So we're doing our think tank on the last day of the who meetings.

And then the Saturday is the rally. Uh, it's, we it's already. They've been really well organized. They've got police organized, let's say police support protection. They've even, they've even organized escape routes for speakers and everything. So it's just, they are planning on their, on their distinct possibility that, that things could get a bit hairy.

And for the live streaming, they're organizing backups for backups for backups, you know. Is there any discussion? Robyn, from those speakers and those international people that you refer to in that group. Are they, um, are they alarmed about what's happened in Australia? Do they think that, you know, we've been the worst hit or, or one of the worst hit in all this?

Australia, Canada, New Zealand. Uh, and they're aware of that. Yeah, very much so. In fact, a lot of, when you go looking through the papers, Um, so Dennis Rancourt, Canadian, uh, published a great review of the 17, of 17 countries in the Southern Hemisphere and, and we featured quite largely in that because we're the heaviest vaccinated and we have one of the highest excess mortality rates.

So we featured quite highly in that. We also featured very highly because it is very obvious from the patterns of our COVID disease. We had almost no COVID in the first wave. We had a grand 954 deaths. And that's with them artificially doing whatever they could artificially do. So 954 deaths in the first wave of COVID, we had two months with no COVID deaths at all.

Then we started injecting, well, when peak injections were coming by August, suddenly July, August, September, our mortality rates, both our COVID rates go up. Our COVID death rates go up and our excess mortality starts to kick in. So our peak bad month was January of 22. Now that's interesting for several reasons.

So, so to the statisticians like Dennis Rancourt, that's an absolute gift. Because we had no COVID through the time of the so called pandemic, virtually none, and dramatic amounts of COVID through the times of what was supposed to be the milder infections. Coinciding beautifully. And they can calculate it statistically, I'm not a statistician, but coinciding beautifully with the rollout of the injections.

So Australia is a test case in that sense. We show it beautifully. And because, uh, we supposedly have 97 percent of our population vaccinated at least once, um, we're in trouble. Do you think it's only a matter of time before Moderna and Pfizer are withdrawn? No. To be honest, I think the withdrawal of AstraZeneca was a deliberate setup.

It was used as a scapegoat. They started targeting AstraZeneca very early in the piece and acknowledging the powers that be, the adverse side effects, everybody's were acknowledging the AstraZeneca side effects right from the start. Has that ever happened with Pfizer or Moderna? We had health minister Butler come out in Australia the other day, praising AstraZeneca for the fact that they.

Saved millions of lives with their vaccine rollout.

Crazy. They, will, will, whether you want to call it willful blindness, whatever you want to call it, it's, it's unbelievable. And I think that's, that is why many doctors and scientists are being slow on the uptake because they can't believe there can be this degree of. Deception, whatever words you want to use, you know, malfeasance, the list goes on.

You can't believe there can be this degree of falsehood about it all. What's your gut feeling, Robin, about, um, the AstraZeneca has obviously been removed. Uh, how do you think that Pfizer and Moderna compare, uh, to, to the AstraZeneca? Well, they're quite different. It's different technology. I What's similar is that they, they all involve the spike protein.

So, but the difference with the AstraZeneca is that we don't have evidence that we've got ongoing manufacture. There are also differences in the lipid technology used to deliver the mRNA. So there, there are many more components in the Pfizer Moderna of concern than there are in the AstraZeneca. You know, even the Novavax is, is not safe.

But that's because anything to do with the spike protein that's using full spike protein is not safe. because the spike protein itself is pathogenic. So, but with the mRNA, we've got added layers of other stuff going on. We're still getting a handle on what all those added layers are. We've got the DNA contamination, the E.

coli plasmids, the circular DNA contamination, which can incorporate in the nucleus. And that's got several concerning components in it, the simian virus 40 component and so on and so on. So it's, it's, There are layers to it. So I think the Moderna and the Pfizer are way nastier than the AstraZeneca. So the AstraZeneca gave a fairly clear set of side effects, right?

And that in a sense made it easier to target. It was a fairly clear set of side effects. It went pretty much straight into the, the cotton, into the clotting story, cerebral venous sinus. It's essentially the, uh, the scapegoat here and, uh, you know, here we go, Moderna with their family down in Melbourne and Brisbane.

I really believe that AstraZeneca was a deliberate scapegoat, but the trick with the Pfizer and the Moderna is because there are so many different levels of pathogenicity, so many different ways these injections can cause a problem. There is a myriad of side effects, so it's like it's harder to nail.

Because they, you know, your average person, your average doctor goes, well, it can't be possible for one thing to cause all these different side effects, you know, it's like that can't, can't be. Robert, if I could ask you, there's been some narrative, uh, around the world starting to surface, uh, around an issue that, uh, vaccines, uh, a figment of people's imagination, sorry, not vaccines, viruses, are, um, do not exist.

What's your, what's your take on that? It's not that they're a figment of imagination. What, we need to understand what viruses actually are. So viruses are a collection of genetic material. They can be RNA viruses, they can be DNA viruses, packaged in a lipid membrane, basically. So that's what a virus is.

So what's interesting is that our own bodies make things called exosomes. So when when our bodies aren't well, and there's something going on that the body's trying to deal with, it will cut out that it'll, we've got our own CRISPR type technology, so we, it'll cut out those bits of DNA that are a problem and package it up in our, it's called an exo, so exo coming out, so like it pushes out of the cell and as it pushes out of the cell it takes part of the cell membrane around it.

So it becomes its own little genetic material surrounded in cell membrane. The body deliberately does that as a way of both getting out what's the problem, that then goes out in our secretions and everywhere else, but also as a way of sending a message to the rest of our cells, I've got a problem with this stuff.

Can you help me fight it? So that's what we do. So along comes the virus story and the viruses. Are also genetic material wrapped in a lipid membrane, come into our body, get our body to make more of it, that then gets pushed out of the cells, wrapped in lipid membranes and excreted. So you can see the similarities in the process.

It's a, it's a tricky question. Very few of the viruses, and I dare say none. It's always dangerous to say none or never or, you know, let's say very few of the viruses have actually been cultured. According to Cox postulates and and proven to exist in their own right. What are Cox postulates? This goes back to a German pathologist Robert Koch, 1700s I think he was.

Um, but this is looking at the back. This is, really started off applying to bacteria, which is that you can take the secretions from an oral tissues or from an animal that's sick, culture it, isolate the offending agent, put that into another animal, make them sick, isolate that again. So you, you're able to isolate the stuff and you're able to prove passage.

That hasn't been done successfully with almost all, if any of the viruses. So this is, this is where there's now coming, uh, but But genetic material, but let's say the constancy of the pattern of the genetic material of the viruses that we call certain things has been confirmed. So does that mean there's separate entities that are doing this or is it that that that particular pattern of genetic material if someone gets rid of it correlates with these symptoms, you know, I mean, it's a tricky, it's a tricky one.

It is indeed and I'm really sorry to say we're out of time. It's been a, it's been a very enlightening interview as always Robin and we love the work that you're doing you're putting so much of yourself into this fight as so many people are. You're over there. I don't know what's happening to your practice back here in Australia, but you're over there fighting the fight and, uh, you know, you're doing what, what we all should be very grateful that you're doing.

And we thank you so much for it. Thank you, Graeme. It's, look, it's, it's an incredible honor and privilege to be working with some of these amazing people that I get the pleasure to, you know, to spend time with and work with and, and be encouraged. You know, I think the thing is that when, when you're in doing it with these sort of people, Because we're all on the same page, we're all looking to the same things.

There is so much support and encouragement that comes from that. I think everyone needs to take some of that away and be encouraged. There are people around the world who are taking a stand and are doing things, but we do need more support. We do need everyone else to, to wake up and do what, what is, what have they got in their hand they can do?

You know, everyone's got something. Is it, is it making some meals for the local next door neighbor? Is it, what, what, what is it? Everyone has something in their hands that they can be doing, and this is what we've got to do now. We've got to become a lot more community minded, a lot more aware of what's going on for others, and not just ourselves.

Absolutely, and that's been the big take out, I think, of the last four years, John, has been, uh, the need for community, the realization that we're all intricate parts of a jigsaw puzzle, we all have a role to play to keep the picture complete. And when one of those things are missing, the whole thing doesn't work.

So one of the greatest forces in my heart that keeps the jigsaw puzzle together is Jesus Christ. And as always, I'd like to close with a prayer, if you're happy with that. I'm more than happy. He's the source of my life. So absolutely. Dear Lord, Father in heaven, what a privilege it is To speak honestly and openly, to feel protected in doing that because we know you're watching over us.

And father, at this time, we still know that you're in, you're in control of this great controversy that we find ourselves in the battle between good and evil. And father, we just pray that you will keep us in the light, have us always gravitate to the life, like to the light, like a moth to the flame, because the darkness holds nothing for any of us.

So father, we ask you to bless this project that will be happening, the Geneva project. We ask you to watch over Professor Robin Cosford and her crew that she's working with, and indeed all of us, Lord, that we may stand in the light of truth and bring us peace and the knowledge that you are still in control.

In Jesus name we pray. Amen. There is a lot going on out there, everybody, and a lot of you are still anxious. Don't be anxious. Get out there in the sunshine. Enjoy the sun. Stop mining for darkness. You know, we don't need to find any more. It's all there. Go out and enjoy the sunshine. Enjoy the fresh air. If you love somebody and you haven't told them, for goodness sake, call them.

You may save their life, as we discovered in our interview with Anne Sheerman the other night, which has had great responses, John. Um, so, you know, let's be about compassion and loving each other and building our spirits back up again, because, um, Satan is the one who's out to destroy us, and we're not going to give him the opportunity.

Um, Johnny, you've often been heard to say, You just couldn't make this stuff up. You couldn't and stay out of the trees, everyone. Professor Robin Cosford, we wish you well. We thank you so much for your time. God bless you. And to all of you watching Club Grubbery, we'll be back on Monday night. Monday night, who have we got?

Um, I forgot already. Sunday with Michael. Sorry? Oh, Sunday with Michael Gray Griffith on Cafe Locked Out. Renovating Australia. We're looking at how we can renovate the Fixer Opera which is the nation Australia and we're looking forward to having a lot of fun with Michael. Also, tonight I uh finished recording uh week number eight in Church Without Walls and a lot of you are looking for that and it's going up as we speak.

And thank you for your support of that. [www.churchwithoutwalls.com.au](http://www.churchwithoutwalls.com.au) for all of you looking for a practical journey to faith. And that's all it is. Very simple and lots of you embracing it. So thank you. And [www.clubgrubbery.com.au](http://www.clubgrubbery.com.au) Please support us there. We need you to, uh, to subscribe to our, our website.

And if you happen to buy a t shirt from [drifter.com](http://drifter.com), that really helps us as well. So God bless you all stay out of the trees. And we'll see you next time on Club Grubbery. Bye for now.
