

Club Grubbery - Raw transcript of interview:

2025-02-10 Graham and John speak with Ingi Doyle...

Well, hi everybody. And welcome to another episode of Club Grubbery. Uh, John, it's been a pretty harrowing week, hasn't it?

Yeah. It's been a lot of, uh, horrific stories, Hooty. And uh, yeah. Yeah, one after the other and events are happening in the US, which hopefully will give us a bit of hope, but, uh, we keep soldiering on.

We keep soldiering on, uh, all of our viewers will by now have seen the two parter we did with Karen Kane and bringing in Anita Huffmeister from, uh, the Australian Vaccine, uh, Risk Network. Um, that was really harrowing and I mean, that goes back 30 years, John, and we've been pushing this. This for four years, and these people have been fighting this stuff for 30 years, just like the crew from Infected Bloods Australia.

They've been fighting this garbage, this medical tyranny for 30 years, and we have to keep the pressure up. And in order to do that, we're, uh, we're going to be interviewing two incredible women, uh, this evening on our program. Firstly, we have Inge Doyle. Welcome to the show, Inge.

Hi, Hootie. Hi, John. Thank you for having me.

No, it's great to have you. And we're having video problems with our other guest, uh, who is Debra Lee, uh, who has become a pseudo, uh, what can we say? Documentary producer. Debra, great to have you on.

Thank you, Graeme. Thank you very much. Appreciate, appreciate the opportunity. Thank you, John.

Right. So Deb, you've been doing some great work.

Uh, you've done an awful lot of research and you've also turned your hand to documentary filmmaking. And, uh, you have, apart from some other projects you're working on, which we'll talk about on another episode, you have filmed a 15 minute documentary on Inge Doyle. Inge, you and I shared a stage together in Brisbane a couple of years ago.

Yes,

we did. Yes.

I remember listening to your story then, and, uh, it's a fascinating story, and this documentary tells it all. So what we might do, is now show that documentary and, um, and, uh, we'll give people a chance to watch this 15 minute documentary and then we'll come back and talk to you both about it.

Is that how we want to do it?

Thank you. Here

we go.

My name is Ingi and I do personal training and I also teach a lot of aqua classes. That's what I love doing and I've been doing it for quite a few years.

Her whole life she's been about fitness. Not only in her job, she was always on a podium. Her eating has always been exemplary.

I don't think I've ever had a fully blown flu in my whole entire life.

She's addicted to fitness. She's literally, she's addicted to fitness.

To look at her, you go, wow. I wish I was as fit as you are, but she's been impacted because World Cups are over.

It's within the four walls of the family home where the deadly virus is spreading.

Up until everyone is vaccinated, um, communities are going to be continually put at risk. If you truly love your parents, your sisters, your best friends, please stick to the rules. Yeah.

Yeah, we were doing everything. Um, our initial response was to lock everything down, make sure our staff was safe, um, make sure our business was doing what it could do.

When we were told we had to have the vaccine to basically get things to get back to normal, we thought we were doing the right thing.

The

first day after my second vaccine, I ended up with a massive swelling under my armpit.

It was like huge and was hanging down, so I went to the GP to get it looked at. The GP said to me, the first thing she said, Oh, I've never seen this before. But over the next week, I started to feel a bit sluggish. I couldn't push myself. It was just weird. Something was starting to feel quite wrong. On day 14, very suddenly I felt a sharp pain.

It was instant. It was no build up. It was just bang. It was like somebody stuck a knife into my lower abdomen on the right side and the pain was radiating through into my back. We got to the hospital, it was just before midnight, Sunday night. They assessed me and sent me off for a scan to see, check out, check for appendicitis and there was a few of them that came back, not just one person, there was I think maybe three of them stood there, they looked quite serious, and they told me you have an aortic dissection.

I was

on my way to Tasmania and there was a message from Minky saying, I'm in the hospital, I've got a ruptured aorta. I knew what a ruptured aorta was. I figured that she was still alive, but I didn't know in what state because I just got that one message and I couldn't do anything.

She had the reaction and I was booked in for My second dose, because of COVID, I couldn't go into the emergency department at the hospital, literally a wall away from the emergency department that she was in.

I was almost in tears with the nurses saying, can you get me in next door? Then

they explained to me what it was. And in my case, it was a tear from underneath the renal arteries. inside the aorta, all the way down to the iliac branches. And she

just said, I've ruptured my aorta, I'm in here in the hospital by myself, they won't let Scott in, I don't know what to do.

And from my past working life, I knew exactly what the outcome could be. So my thoughts were that, um, That by the time I get back to Tasmania, from Tasmania, I'll be going to a funeral.

Ingy was in hospital as I said, um, um, we didn't know why.

She didn't fit into the category of the old women that didn't do exercise. She didn't smoke. She didn't have high cholesterol. You know, she's never been overweight.

You know, it was clear that a person her age and fitness should not have been in their department.

So I went home and I remember sitting upstairs thinking, I can't get used to this. This is not me. They said to me, surgery is really, really risky. Like, it's not a good option. So we will treat you with medication. Basically suppressing blood pressure, suppressing heart rate. I try to stay positive and I'm thinking, you know what, I come back for the re scan two weeks later and I will be just fine and would have healed.

Day 14 again, I went back in for a scan and my phone rings.

I could just see by the look on her face like she just went white and she just said, I've got to go to the hospital and I'm not allowed to do anything, I'm not allowed to drive, I just have to go.

And they then told me that the dissection had spread, or basically haematoma had developed above the top of the dissection and it was closing in on my renal arteries.

We were just driving down the road.

In fact, we were coming down that road along here, grabbed my hand and she said, Stop, you need to pull over. She just said to me, my children are still so young. She said, and my daughter, she's still really young. And she promised me she will be there for them and for Scott, no matter what happened to me.

She was just petrified. I have never seen anybody so scared in their whole entire life. At

what point did you ask, why is this happening?

At what point did anybody ask, why is it happening?

The first stint in there, I was sitting in bed thinking, What is this? What is this? Scott also was wondering what's happened to me.

I sat down and wrote a list of all of the things that could have possibly be just a list to ask. And, and, um, and, and one of those things on the list was the fact that she'd had a vaccine.

There was only one line of a two page document.

They thought, Oh, could this be vasculitis? For example, there was, you know, Notes in my medical records, vasculitis, question mark, you know, but they did scans for that. Nah, I ruled that out. And then they thought, could it be something called FMD, which is a genetic condition?

Uh, they went looking for FMD everywhere, they couldn't find it.

As I said, you know, one of those things, just one item was, was the vaccine. Just one. And that was quickly dismissed because it was, it was quickly dismissed as no, that's not how vaccines work. But then I started to get to the end of the list.

So basically they have literally ruled everything out because every part of my body has been scanned. I've had every blood test you can imagine to try to find something wrong with me. They've looked into everything. There's only one thing left.

Hi, my name is Sakshi and I'm a doctor. I'm going to explain how we know Australia's COVID 19 vaccines are safe and effective.

Australia's COVID 19 vaccines have passed the Therapeutic Goods Administration's strict tests, which means they are safe and effective in preventing people from getting very sick and even from dying.

Two weeks prior, she had had an injection and I thought I was crazy. Because this is before anybody had any information.

I contacted a vaccine expert from Adelaide, by the name of Nikolai Petrovsky, he's a professor. And the day that he Sorry.

The day that he, the next day he got back to me. And he explained the physical process that had occurred inside her. The damage to the endothelial being caused by the expression of the spike protein from the vaccine. That he was the first in the world to model the COVID virus. The first in the world.

This is his area of expertise. It just, the weight left it off my shoulders. I just, I was not insane. I was not looking for something. I was not crazy. This was real.

Well, in the last couple of years, essentially the health authorities said about silencing people. Anyone who questioned in any way the narrative that they were trying to tell, of course, Unfortunately, none of those things are actually true. That's, and that was the fundamental problem that people like myself and, and many other experts in the area, I mean, what were we to do?

You know, um, and, uh, for the first time they've set out systematically taking down and, and silencing discrediting, you know, debarring, you know, deregistering, removing academic titles of anyone who questioned the narrative.

He said a possible explanation would be that the liposomes transfect the aorta and get expressed in the endothelium, triggering, triggering an inflammatory T cell response that then triggers a rupture and a dissection.

If there was tissue preserved, then the first step would be to analyze this for spike protein expression. I agree that this should be properly investigated and treated as a serious vaccine adverse reaction until proven otherwise. Has it been reported to the TGA?

Short and sweet. You know, I finally showed, had a chance to show this to the surgeon after a surgery. Because we basically were forced into a situation where it's like we have, we don't, they basically said, look, we, we understand you want to know why, but we still have to save their life. So we basically just were, were like, okay, you've got to do the surgery.

The email string between us was then shared with the surgeon. He then agreed to, to report it to the TGA and he did. And we've never heard from the TGA. Nowhere.

So as a doctor, we have a responsibility to recognise that if people say they've been harmed by something, to take that seriously, very seriously. And, and, and when authorities are saying, no, this is 100 percent safe and effective and there is no way that anyone has been harmed and that, that is, that is the responsibility.

Public health gone wrong. That, that is public health that needs to be shut down. And so absolutely people like myself are under a moral obligation. When public health goes, goes mad and actually does the opposite of their name and actually starts harming public health. Of course, someone has to speak out.

I mean, that's your duty.

Injuries are everywhere. Like every week I meet people, talk to people through my job and there is always another story coming up, always another story about somebody they know, a family member and I'm surprised

that so many people still have their head in the sand and don't. Maybe they don't want to know because if they do know, they have to react and do something about it.

I can't imagine what people go through who has not had the support I've had. I just don't know how they could do it. Where would they be? I do not know. As Australians, we are supposed to be down to earth, friendly. That's one of the things I noticed when I came here. You walk around on the streets, people acknowledge you.

They say good morning, whatever. And that's the nature of Australians, which means you like to reach out to each other and help. And to kind of check on people, even if you don't know them, you have a natural instinct to do so. So I think we all need to open our hearts, And look out for each other. 'cause if you don't have the support and you're going through these, you won't survive.

Sometimes you say a lot when you don't say anything at all.

John, we have done probably over 500 interviews. We have interviewed the top people in the world who have a different narrative to that of our government. And we interviewed Dr. David Martin less than 10 days ago and we posed to him, is our government trying to kill us? And his categoric answer was yes.

We've done enough of these interviews now to say to the people of Australia, if you're not waking up, you're in denial. And that means you don't even know you're lying. We're also told, we've been told John by experts in the field, Professor Dalgleish and many others like him. That probably only 1 percent of vaccine injuries are being reported.

1%.

We have come to the realization after four years of doing this, and seeing stories like this over and over again, and we are two rational men. There's no doubt about that. We're rational human beings. We are risk benefit analysis kinds of people. We do that, we did it for our living. Our government is determined to make us sick, and our government seems to be, whether they know it or not, determined to kill us.

They are not listening, they never do, they didn't listen when thalidomide was brought forward. We're sick of apologies for stolen generations. We have seen thousands of people who were given tainted blood products over 30 years ago, who have still not been recognised. We've seen the pelvic mesh scandal.

How many medical scandals do we have to have in this country before this country realizes that we don't have a health system? We have a disease management system and it's not managing disease, it's creating it. It's time to restructure the whole process.

That, that, uh, Deborah, is a cracking piece of documentary filmmaking.

Thank you, Graeme.

So,

John.

I mean, I, I feel like, Hoodie, that we're, we've been sitting on the jury at the, at the events for Auschwitz. Uh, we've heard the testimony of witnesses. We've heard the testimony of victims. We've heard expert after expert after expert tell us what went wrong and what is wrong, but there's nobody on trial.

It's just empty. There's no one there, sitting there, who's responsible. These people, and it doesn't matter who you want to start with, I mean, from the Prime Minister down in this country, they are all culpable. They are all in the chain of custody of what's going on here. And the fact that they just continue to ignore this and treat those in Parliament like Senator Gerard Rennick.

Malcolm Roberts and, uh, Russell Broadbent with absolute disdain and contempt when they tell the stories of people like Inge in the parliament is, I don't know, it's reprehensible.

I sat last night for 12 minutes and listened to Jackie Lambie's speech in the Senate where she was about to dump on Pauline Hanson's bill.

The, the, the speech where she says it's about being a goddamn bloody adult.

And that, that kind of ignorance is why we're in this mess right now. Now, you know, there are people like David Martin who say, yes, the government is trying to kill you. Now that may be true. There may be elements of truth in that. Uh, it's certainly happening. If not deliberately, it is certainly happened by happening by misadventure.

Uh, if the government was a person, if the Australian government was a person, it could be charged at the very least with manslaughter.

And I can tell you, and I know I'm speaking for you, John, we are getting sick and bloody tired of the emptiness that comes back when we do programs like this. Ingi, that, that, uh, aortic dissection, I mean, that's up there with massive brain trauma. That's that, that doesn't get much more life threatening than that, does it?

No, it was a crazy, crazy time. And that all happened back in 21. Like, for example, I had this massive surgery and they had to cut me completely open and take the damaged piece of aorta out. And their water sits right next to your spine. So they basically cut through your abdomen and go right back, and everything has to be moved and being cut through to get there.

And, um, through the process, I mean, one of the biggest risks they told me was bleeding out. And through that first surgery, they nearly lost me because I lost all my blood as much as the body holds. And obviously they replaced it, but everything, I bled so much, they lost the lot, um, but they managed to keep me alive, but I guess the trauma from that was, they have to clamp the air water off and all the organs that are below where they're clamping has no blood.

And that was for this surgery. It took 12 hours. So that was quite a few hours. So hands had all these massive complications that I should never have had. And one of the complications is a big lung clot that I still have that blocks off one lobe of my lung. I had permanent damage to my kidneys. One of my kidneys took a really big hit from the lack of blood.

I had, um, you know, joint issues, pains, chest pain, the list. Then autoimmune disease, you know, all of that came from the backs as well, which I've never had anything before. It was just ongoing. And the recovery from that was horrendous. I had weeks in hospital and I was so ill and so weak for so long. So it's, I was quite amazed that, you know, a year later, I, even though I've got those issues still, that I will have for life, that I have kind of, you know, Come back to some sort of normal life.

I mean, I did get back to working nowhere near as much as I could do before. Um, I couldn't get back to my, my triathlons cause I've got blood flow issues from the surgery into my leg. It's just, yeah, the after effects is just, they're there forever. And I think that's why I think it's so important to share because once we are injured.

If you have scarring on your heart or neurological damage, it doesn't go away. You can detox, you can, you know, try, you know, the list is a mile long things we can try and do for ourselves to help ensure those things to help. And some things will improve a little bit, but I think once you're damaged, you are damaged forever.

Like I will have a lung clot forever. I will have low kidney function forever. My heart ever so often, I mean, then out of emergency, you know, this has happened over the years since this happened as well with, you know, all

the, you know, chest tightness, chest pain, pain, you know, all those classical symptoms for a heart attack, even though there's nothing wrong with me.

These things happened and. And you are just scared and you feel like you're living, you're a ticking time bomb. And that hit me so hard last year. Well, it's just been, yeah, in, in July, um, 24, I got some weird pains again, like some really, really weird pains. That was quite intense around the hip. And, um, I thought, okay, I've torn something because I've been doing a little bit of exercise and I thought I've done something.

So I went to the chiro and he had a look. I thought maybe I put something out and he said, no, this is not a normal pain for what you're, you know, thinking it might be. So then I went to the GP and she sent me off for a CT knowing my history. She took it quite seriously and she probably saved my life because.

As it turned out, the graft they put in, in 21, when all this happened, had gotten infected. So, it was like an aneurysm with infection at the joint of my tissue and the graft tissue, and the whole graft was infected. So that was like three years later when I'm thinking I'm kind of getting something back.

I'm getting somewhere I'm hit with this and this should never have happened. So of course I was rushed back into emergency, back into hospital and they had to decide what to do. And initially they put me on a massive amount of antibiotics, of course, to try to kill the infection. But because I had a synthetic graft from the first surgery.

The synthetic graft doesn't have blood flow through it, so antibiotics can't kill an infection like that. So, they said to me, basically, I had three choices, oh sorry, two choices. The first one was sticking on heavy duty antibiotics, probably for life. And, you know, try to keep it at bay. And they said, how long we can keep it at bay for?

You know, how long is a piece of string? They didn't know. They couldn't say. I could live for two months, three months, four months, a year, maybe, maybe five years if I'm lucky. And then I will just, the infection will take over and I'll have a rupture where the graft was, where it joins my tissue. That will basically, the graft was safe, but the tissue where it joins, that will eventually rupture with an infection.

So I would bleed out and die. So that wasn't a very good option, not knowing how much I would have left. So they, because of my age, I'm only in my fifties and they said, we want to try to give you at least 30 years of life. You know, that's what they were aiming for. They didn't want to settle for anything else.

So lucky for me, I had an amazing medical team. They were brilliant and they planned it for a month. I was kept on antibiotics for strong antibiotics, more than two or three different kinds to try to keep this at bay. And then they planned my surgery. So that took a month to plan it. And what they had to do was cut me open completely again and go through all the scar tissue I have.

I got so much scar tissue from the first surgery and that was really risky. So they didn't really know what to expect until they got in there. So, They planned it and they did execute it and they did cut me open and they took the old graft out which was infected, infected, so obviously they had to be cleaning, they couldn't even leave one little piece of infection in there, so it was quite A tricky surgery for them to clean you all out.

And then they replaced that. They got a special graft imported from Germany that wasn't approved by the TGA. And I said, yes, I'll have that. Thank you very much. It's not approved. So they actually got that in specially for me and that had, it was infused in silver in a, in a particular way. So the silver infusion should last 12 months.

That's that you can get some silver infused ones in Australia, but they would only guarantee a year. You know, two or three months, maybe that the school would last. So this one I have at the moment should last a year, which means in the meantime, they can really hit me with more antibiotics, which they did and hopefully keep any little tiny bug away.

So it can't grow again in the new graft. Cause I mean, that's still a question mark. This is not even a year gone yet and I'm still having scans and stuff. So anyway, but do that surgery. And that took 18 hours when they closed me out. So that was huge. They had eight surgeons because they did a few extra things like putting, uh, some stents into my ureters through my bladder so they could find, so they wouldn't accidentally cut through the ureters.

from the kidneys to the bladder because so much scarring in there. So they did that first. So they had a couple of urology surgeons there. They had general surgeons there because they had to cut a piece of bowel out because it was sticking to the graft that was infected because of the mess inside from the first surgery.

So they took a chunk of bowel out, only a small piece, you know, nothing that's going to affect me, but still that was, you know, another thing they had to do. And they also went through some extra lengths and put, I got a massive scar sort of up here near the clavicle and they put a couple of outside steps into my artery that ran outside my body down, one down to each leg.

So they did that as well. So they had my blood circulating through my legs because once they clamped their water, uh, of course there'd been a blood supply to my legs and my kidneys are already damaged. So they didn't want to damage them any further or me risk of losing my kidneys altogether. So to help the kidneys.

Sort of come back a little bit better after that surgery. They thought we gotta keep the blood supplied to the leg. So they went through the length of doing that and I think that was brilliant because um, yeah, it did help. So my kidneys, when I came back from this surgery, when I went into the surgery, I should mention this too, they said to me, there is one in 10 chance.

That I wouldn't wake up, that I would actually die. That's how dangerous this second surgery was because they didn't, you know, so, but I didn't have a choice because if I didn't have the surgery, I would a hundred percent die. In a much, you know, I wouldn't have much life left how long they couldn't tell me, but one in 10 chance of not waking up.

I'm thinking that's almost like playing Russian roulette. That's like, that was really scary. And I have to tell my kids, um, Scott, obviously my partner and, you know, to tell them that I might not wake up. So, you know, we've got to make this decision. Should I take a chance? I'm not waking up, you know, when they do this in a month time, or should I just take a chance of having five years and then die from an infection?

Like it was, it was really scary. And they also told me that it's 25 to 50 percent chance. I wouldn't have kidneys when I woke up. So if I woke up, so it was really, really, really awful. And this is, this three years after when I had injury and thinking I'm getting back into life. So what I'm trying to say with all this.

It's basically, it doesn't go away and I don't actually know what my future holds. I'm feeling, like I said, I'm feeling quite good at the moment. I'm thinking I've got it over it. And I have come through this major surgery, um, surprisingly well. And I think I have my fitness, but I have a base fitness. I think that.

You know, that's been the biggest thing for me. If they didn't have that, that would never have attempted a surgery number one, and I probably would not have survived. Uh, once you're injured, it doesn't just disappear. You can get hit by something at any time. And that just devastates me. Absolutely devastates me.

And that's why I'm doing this. That's why I want to share. So people know. You know, it's not like, you know, you have a cold or a flu for a few weeks or whatever, and then you kind of heal and, you know, it's forgotten. You know, people see me and think, you look quite well, you're looking really good now, you're doing your thing, you're working, you must be fine.

And people forget that. Yeah.

Inge, I need to ask you some questions about TGA and their response or lack of it. Nikolai Petrovsky suggested that pathology be conducted on tissue that was removed to find spike protein. Was that done?

No, not yet. I have tried privately to find somebody that can possibly test it for me, and I haven't had any success.

Nikolai was, he offered to test for me. He was amazing when that all happened. We sent some tissue to him and then he got kicked out of his lab so he couldn't do it.

Which is convenient. How convenient. Now the TGA, and let's remind everyone, John, the Therapeutic Goods Administration in Australia is the most heavily funded organization of that kind in the world by Big Pharma.

95 percent of its funding comes from people like Bayer, Pfizer, Moderna. Um, and their performance, John, in the last four years has been abysmal. It's been criminal. Now, you reported this injury. Your surgeons reported the injury?

He did. He did it back in 21, November 21, it was reported.

And they have shown zero interest.

Absolutely zero interest, nothing. And my, my, even my, um, report disappeared recently. Um, Sharon Cousins, who runs the Open Day In site, that's her site, and she informed me she, she was looking for my report and had, had disappeared. And I started to tell people and share that. And then it somehow appeared again.

So it was gone missing. I searched for it. It wasn't there. So I don't know what happened there. Uh, but it has come back now, but, um, yeah, it's bizarre. Nothing, not a word, nothing.

Now that, that, uh, by any, by any test of the law is criminal negligence by the TGA.

Absolutely. They should be made. That's what they're for.

If you report something, they need to investigate every single report. They have to that. I mean, that's their job. They telling us this is safe and effective, and they are happy to push this onto all of us. And. Then they do nothing. They turn their back and pretend it didn't happen.

Johnny,

I don't know what you say. Uh, you know, look, the TGA, uh, uh, does grubby mongrels, uh, you know, that they, uh, I'll tell you what I'd love to say, but I can't say it here. It's just unbelievable hearing this story and the fact that they've just been so criminally negligent. I mean, how else can you put it? I mean, it's an absolute disgrace.

Uh, but Deborah, it must make you. Absolutely fume, mustn't it? You know, that you're having to do the work. of organizations like 60 Minutes. I mean, here these mud runners are at 60 Minutes, you're an absolute shocker. I mean, how anyone watches your bloody program, I do not know. You ran a story there last week about a couple of kids that died of methanol poisoning.

Now, fair enough, tragic. Uh, and my Uh, prayers and, uh, and, uh, condolences go out to the family of those two girls that were, uh, involved in that. But here, these grubs at the TGA, these pigs, uh, I don't know what else you call them, are killing thousands and thousands and maiming Australians and nobody in the mainstream media other than a few like Chris Smith and a few others.

Give a toss.

Can I just comment on that, John? Because you're 100 percent right. Why? I'm, I'm a retired accountant. I'm supposed to be retired. I'm not a filmmaker. I had to find my own funds, my own time, my own energy to, uh,

and I hired a professional film crew because obviously I needed to get this out. To that same level of quality of a 60 minute film to, for people to sort of pay attention, you know what I mean?

I needed them to pay attention that this is really serious and this is not rare. These illnesses and diseases and, and, and terrible things that are happening and deaths, they're not rare. And that's why I'm passionate about putting in whatever I can, time, effort, money, whatever I can to help get this message out there.

Because as Inge says in her documentary, she's had a lot of support to get through this, but there's a lot of people out there that don't have that support. And in fact, in many cases, they're actually being criticized by people for daring to suggest that this may have been caused by. An experimental injection that the entire population was coerced to take by government leaders.

It's just unbelievable to me and I cannot sit back as a third generation Australian who loves my country and who loves my fellow Australians. I cannot sit back and watch this happen without speaking out in whatever way I can to try to. help people understand what's really going on out there around them.

Um, I think as you said earlier, um, Graham, how anyone could not be seeing this at this point is beyond me, but there are a lot of people that still aren't seeing it. And, and that was really my motivation for doing this particular film and creating more hopefully in the future and others that I've already done.

Because I just feel that we need to find a way to help everyone understand what's truly going on. Not just those that have been doing the research over the last four years. But everyone needs to know this. Everyone needs to hear Ingi's story and all the other stories like Ingi. That's my personal sort of motivation.

I want to say once again, for those who may have missed at the beginning, your face isn't being seen at the moment because we're having issues with your camera. Uh, but we're really great to have your voice on. And, um, we're really grateful to you, Deb, for, uh, stepping out of your retirement as an accountant.

And, and making documentaries like this because I reiterate that was a cracking bit of documentary filmmaking that really, that really got to me. Um, I'm going, I'm appearing a week from today. I'll be getting home from Sydney where I've been. Well, I will have been on the SPS Insight program talking about My Body, My Choice.

I will be sending that documentary to the producer of that program to get them to look at it before I go on. Um, and I'm pretty sure that they will. So

thank you, Graham. That would be great.

We reiterate in this that John and I have been for the last four years striving to crack through the echo chamber into the mainstream.

That's why there are some issues we don't touch and we're trying to be disciplined and diligent in the way we present things. Um, but, and also we try not to be too overly sensational. John David Martin, uh, told us, uh, not on recording off camera, that he and many other people studying this material are convinced that the death toll from the vaccines for Covid will be in, in excess of 2 billion people.

Yep. And that's been reiterated to us by numerous experts, hasn't it? Hoodie, um, off camera. Um. I mean, certainly a number of our expert, uh, people that we've interviewed have, have given numbers that are still frightening, uh, but this is, this is next, next level stuff. Uh, I mean, it, uh, I mean, I think of that, I think of Michael Looney and I think of that cartoon that he, that he drew, uh, with the tank and the turret was replaced with a syringe.

I mean, that just about sums all this up.

Best bit of cartoon he ever did, and he did it just before he died. Look, Graeme,

could I make, could I make one more comment, if that's okay? Um, I really want to reiterate the message at the end of this documentary that we need to listen to and support the people that are injured, because I agree with you, I've, I'm also trying to be very responsible, um, in the way I share this information, so that we can break through to people that you know, really don't know what's going on.

And I, and I do feel the best way to break through to them is with, you know, these sort of professional type documentaries that are um, calm, not sensationalized. They're just very factual, telling people's own truth. And um, and, and giving messages to people that we all need to stand together here. We, this isn't about, you know, trying to, fight against the system or fight against each other.

We all need to stand together to face what's really going on. And I wouldn't even try to tell these stories if I didn't think there was help out there for people. But we all know there are good doctors that have been researching, um, the impacts of these injections and how to help people that may have been injured.

And if, if we could, allow those good doctors to speak openly without censorship and share what they know. I, I personally feel a lot more people could be helped so that those horrific projected, you know, death numbers will never happen. You know, I, I feel that there is real hope here, but it does rest in my opinion on people being brave enough to face the truth.

Together, en masse, not just those of us who have been watching this unfold for the last four years. We all need to face this together, all Australians, all people of the world. That's just my personal view I wanted to share. Thank you.

And you've got 100 percent support in that view from us for sure. There are people out there at the moment who are mocking vaccine injured.

There

are several groups on social media who are calling the Forest of the Fallen memorials the Forest of the Fake Dead. Um, you need, you need to sit and take stock. Um, you're entitled to your opinions, but I want you to imagine what if, just what if, in a year or two, you realize that they weren't the Forest of the Fake Dead.

They weren't fake dead. And what if some of those projected 2 billion deaths, according to the experts that we've been talking to, and it could be attributed to the vaccine. What if some of those are your family members or even worse, you? Now we get criticized, John's got a medical background. I get criticized because you're a pilot, you're not a doctor.

What do you know? That's exactly right. That's exactly right. That is so true. But this, this is why I am doing what I'm doing without a medical background. I believe that someone is tampering with my immune system and my DNA, and I believe I should have the right to know if that's happening or not. And so do you.

Whether you think we're idiots or conspiracy theorists or not, so do you have that right. We are fighting for your right to find out, because there is an increasing possibility that we are right. Because the evidence, John, is supporting it more and more again. And, and evidence projected by the TGA, ARPA and other organisations who are aiding and abetting the government in making the Australian population ill and killing them.

They're accessories to the fact. And that will be held to, they will be held to account for that. It's inevitable. It's not we're going to hold trials and we're going to hang people. It's inevitable that this will come up. You cannot hide from the truth any longer. And the message from me, I hope I get a chance to say it on the SBS Insight program, will be just that.

No, I'm not a doctor, but there is sufficient evidence for me to consider that someone is fiddling around with my DNA and my immune system. And I believe all Australians have the right to know that, and we deserve a government that represents the people in order to make sure this never happens again.

Well, I'll tell you the other thing too, Woody, I mean, all these organisations, whether they be a hospital, a doctor's surgery, have got some level of governance, uh, ambulance service for instance, they've got their own professional integrity units, they've got their own checks and balances. Uh, we've got how many jurisdictions when it comes to governance, the ZAPRA, the TGA, uh, numerous, there's safe work in, in, in virtually every state.

Uh, there's the Australian Crime Commission, there's the state police, uh, in every, uh, in every province. Uh, we've got governments that are responsible for health at a local government level. Uh, nobody, not, not one unit, not one establishment has taken anything seriously ever and investigated. But here we go, we just keep going down this same old road again and, you know, the best thing that these grubby politicians could do.

Is cancel the first 15 minutes of, uh, question time and play this documentary to Australia and play it to the rest of the politicians. That's what they should be doing. They won't. But, uh, that, that, that should, that should be the first thing they do.

Well, we'll be getting this program to, uh, Russell Broadbent again with the others that we're sending.

Uh, and we, we remember Kiana Probert and her two children stripped away from her, put in the custody of two African men. Who are carers for the Department of Child Protection in Cairns because she wanted a second opinion on the leukemia diagnosis of her eldest son, eight years old. Red flagged by an overzealous, uh, gynecologist, not gynecologist, I'm sorry, oncologist, who said that if she wanted a second opinion, that was a red flag and she was going to report her to docs.

Um,

I am talking to colleagues who are desperately ill from ex colleagues at Qantas. And John, we have recorded some video of pilots, uh, giving a testimony about the way they were treated by Qantas to be released posthumously after their death. Because they're still trying to get some compensation.

Well, and not only that, Hootie, we've still got a pilot who's about to come up before the federal court that was sacked by the spirit of Australia, those grubs down there at Qantas.

Yep.

For not having the vaccine whilst he was on sick leave being treated for cancer. What a mongrel act. Yep.

Now, Inge, I have to say watching Scott's testimony on that video nearly brought me to tears because I put myself in his shoes. He obviously adores you. Uh, to be separated by the bureaucracy, um, when you were Effectively dying on the other side of the wall.

I mean, there again, that highlights another issue. And when we saw the footage of those premieres saying what they were saying, John, I don't know about you. I was so angry. I couldn't believe it. I was so how it's got now.

No, he's, he's, he's okay. But he's angry. Like you, he's angry, but he should never have happened.

Like, I mean, I was desperate and he was desperate on the other side of the wall. Um, and. Well, I was in so much pain and half delirious with the tablets. So, you know, all I can do was try to talk to him on the phone and, you know, I couldn't explain. He wanted to be there for me so much and he wanted to support me.

And because when you're in there yourself, you don't take things in because you are so unwell. Like you're so unwell, literally, like you say, dying. So you need somebody else to be there and, you know, take information on board and, you know, hold your hand and be there for you. But I was so scared and he was devastated.

I He was devastated. He didn't sleep. He did not sleep till he could come in and see me. Finally, he got an exemption. It was over a week later and he finally got in to see me. And that's only because the nurses gave him an exemption, an exemption, you know, to go in and see me. That's, I mean, I just, the stuff that was going on, it's, you couldn't even dream this up.

It is so bad. And I mean, I'm just one person. This is, this is, You know, people have not been able to see their loved ones die and say farewell and, you know, cross the borders and all this stuff that went on. I just, I can't believe it got so far with it. It was, yeah.

I couldn't, I couldn't visit my stepmother before she died because I wasn't vaccinated, which is ludicrous because she was vaccinated and everybody in the nursing home was vaccinated.

So if the vaccine is so good, disinoculant, why do they need protection from people who aren't vaccinated? Because isn't it safe and effective? Yeah, it was. Yeah. Yeah. Yeah. All of this stuff is insane and yet people are still criticizing anti

vaxxers.

Anyway, and the conversations that must have taken place with your children, the difficult conversations and questions that had to be answered by Scott in your absence.

I'd love to interview him. I'd love to get him on to get a different perspective as well.

Yeah, he's, yeah, I can arrange that. We can arrange that.

Because I think we need to tell the other side of the story too. I nearly lost Michelle just before we got married. She had massive subdural hematomas that weren't diagnosed for nearly a year, and it almost killed her.

And the doctor told me to prepare for the worst, that she was going to die before we got married. And I spent every waking moment in that hospital with her for nearly a month. I said, you can't stay here. I said, well, I'm staying and they made a bed for me on the floor and all that sort of stuff. And I, and I've got, I've got to say the staff were fantastic.

They were incredible. And, and the people that looked after you, the surgical teams, what, what an effort, what incredible people, you know, and I'll be in the study in March and I'll be speaking on stage with Dr, uh, Ben Carson. You know, one of the greatest neurosurgeons in the world with Peter McCullough and, you know, the, the, the 20s, I think it was 23 hour operation.

He had to do the first successful co joined Siamese twins at the head where he kept them both alive and they're now functioning as normal adults. I mean, The, we, the medical profession, the heroes of our medical profession are being dastardly dumped on by the garbage that's brought down by hospital administrators, our government health bureaucracies and APRA, these agencies who are destroying the medical profession and we need them.

And people like Professor Ian Brighthope and others and the other doctors who've stood up like Nikolai Petrovsky. How badly has he been treated? You know, we're sick to death of seeing our professionals who hold up, hold up the banner of first do no harm with the greatest integrity being treated like criminals.

This country's got to wake up, John.

Yeah, well, it's not, unfortunately, Hooty. Uh, And we know that. I don't know what we can do. Anyway, we just keep, uh, yeah, we keep hoping that there'll be a breakthrough somewhere. I mean, we'll just keep doing it. We won't stop. So, uh, if you think we're going to stop, we're not going to stop because we're waiting to dismantle you because you're a pathetic disgrace.

I would love, I would love somebody to come on to this program from the TGA and dissect this video, excuse the pun, and tell us why they have not reacted to the report of this vaccine injury. It would be very interesting, uh, TGA, and you're more than welcome to come on, but you won't. Why won't they test it?

Exactly.

Anyway,

that's the problem. They need proper facilities so anyone can get tested, proper evidence. I mean, there is so much evidence out there, but they just won't see it. So why don't they set up a testing facility? That's the key to figure out exactly what's going on with everybody and then it can be reported properly and then they can set up.

a hub that any injured person can go in and get free, um, care. I mean, what, what they've done is done. We can't undo what they've done, but we can help everybody that's been left. And it's, it's the key, I think, to, to, um, trying to, um, get out of this somehow better than, you know, the worst outcomes. That's probably around the corner, but yeah, they need to find a way to treat people properly with everything they can.

I mean, the way we're going,

these two, these two buildings that they're building for Moderna, uh, the one in Melbourne and the one in Brisbane, I mean, I mean, they'll be, they'll be palliative care outlets by the time we're, all this is done. I mean, you won't have enough beds for the people they're killing.

Well, we've

got to, we've got to leave it. We've got to leave it there. And I just, I just want to thank you on behalf of Australia, both of you. And Deb, we know that there's more material coming out from you, and this is one, just one piece you've done, and um, as I said, it's a cracking piece of documentary, it really truly is.

Your, your film crew, uh, need to be congratulated, and so do you for funding it. And um, you know, Sharon Cousins, people like that who are working tirelessly on all the stats, doing the work that the TGA should be doing, John. Um, they've got all the data, these people, we've got the data, we have the truth. But you will not listen to us.

Australia, you won't listen. And government, you won't listen. And as the phrase I used to use in emergencies in Qantas when we were a pilot, whenever we heard the phrase, Captain, you must listen, our attention was immediately diverted to what we needed to look at. And Australia, you must listen. Both engines are on fire and we're going down.

You have to listen. So I just want to thank you both from the bottom of our hearts. Um, and we, we want to do more of this with you guys and Deborah, we want to see more of the stuff you're producing and project it out there as best we can.

Thank you, Graham.

And I think now, uh, as customary, we'll close with a prayer and come back for a final comment.

Dear Lord, Father in heaven, we thank you for courage, wisdom, grace, and mercy. We thank you, Lord, that we're able to project the data that we're getting and the testimonies from credible people to a public which is

desperate to need to know. But sadly is not waking up. So Lord, I just pray that truth will keep perpetrating its way into our society and penetrating the wall.

And Lord, we pray, John and I pray for diligence and discipline to keep this message sharp and keep delivering it where the blows need to be delivered. Lord, have mercy on the souls of those people who are perpetrating this outrage on the Australian population. And please cover people like Debra and Ingi and their families with, with your grace and your forgiveness and your mercy and your protection.

And for goodness sake, father, for your sake and for ours, we just pray for more and more truth to come forward and the courage to deliver it in Jesus name. Amen. Um, Johnny, you've often been heard to say. You just couldn't make this stuff up. It's a stuff up. All right. Thank you both for appearing. Ladies and gentlemen watching this program.

You make Australia great. God bless you. It doesn't help if you don't share, please share it. What you did yesterday got us to today. And just remember if you love somebody and you haven't told them for goodness sake, call them. It's that important because the numbers we've been talking about tonight, it's even doubly more important.

God bless you all. And we'll see you next time on Club Grubbery. Bye for now.

Thank you.
